

Acceptance, Durability and Control = Performance.

Rodents' acute sense of taste is a leading cause of bait shyness, as they can detect certain chemicals at an incredible one-part-per-billion concentration. Talon®-G rodenticide is designed to be appealing to rodents while maintaining a high level of weatherability so the bait stays fresh longer. For more than thirty years, Talon-G has been a favorite of professional applicators everywhere because of its superior acceptance, durability and control.

Single-feed. No Bait Shyness.

Talon-G pellets contain brodifacoum, a second-generation anticoagulant known for its outstanding performance against both rats and mice. The most extensively researched compound of its kind, brodifacoum has been proven to achieve control in just a single dose.

- Brodifacoum is labeled for use against both warfarin-resistant rats and mice, making it unlike any other anticoagulant.
- The low ingestion amount needed for control reduces exposure and cost by allowing for a shorter treatment period.
- To maximize rodent acceptance, Talon-G is made with a high-quality grain base.

Flexible Use For An Extended Period.

Talon-G rodenticide comes in a 16-pound box containing two eight-pound pails. In its original packaging, when kept dry and free of contamination, the product remains stable for at least two years.

- Talon-G bait packs allow scent out but keep moisture from coming in.
- Can be refrigerated or frozen to retain maximum freshness.
- Registered for use in and around both urban and non-urban structures, including outdoor burrow baiting.

Formulation Design

The unique mini-pellet design has been proven to be highly attractive to rodents, especially mice.

- Poses minimal risk to non-targeted animals and humans when placed in inaccessible areas or in tamperproof bait stations as directed on the label.
- Contains Bitrex®, a human taste deterrent.
- Vitamin K₁ is the readily available antidote for the treatment of accidental ingestion.

Talon-G Features

- Palatable and durable formulation.
- Active ingredient brodifacoum controls even warfarin-resistant rats and mice.
- Eliminates bait shyness.
- Broad label; can be used both indoors and outdoors in urban and non-urban areas.
- Unique mini-pellets.
